

NPN Silicon Power Darlington Transistors

General-purpose EpiBase power Darlington transistors, suitable for linear and switching applications.

- Replacement for 2N3055 and Driver
- High Gain Darlington Performance
- Built-in Diode Protection for Reverse Polarity Protection
- Can Be Driven from Low-Level Logic
- Popular Voltage Range
- Operating Range — -65 to +200°C

Figure 1. Rated Forward Biased Safe–Operating Area

There are two limitations on the power handling ability of a transistor: average junction temperature and second breakdown. Safe operating area curves indicate $I_C - V_{CE}$ limits of the transistor that must be observed for reliable operation; i.e., the transistor must not be subjected to greater dissipation than the curves indicate.

The data of Figure 1 is based on $T_C = 25^\circ\text{C}$; $T_{J(pk)}$ is variable depending on power level. Second breakdown pulse limits are valid for duty cycles to 10%.

$T_{J(pk)}$ may be calculated from the data in Figure 6. At high case temperatures thermal limitations will reduce the power that can be handled to values less than the limitations imposed by second breakdown.
